

Replacing a container can increase safety and ROI!

Like most things in life, after time, efficiencies are re-visited, and improvements are made to cost and ease of production and delivery.

Prior to ultra-concentrated car wash chemical, drums were the only way in which product was supplied. Like most things in life, after time, efficiencies are re-visited, and improvements are made to cost and ease of production and delivery.

This is exactly what CSI did back in 2010, with their introduction of their Ultraflex product. The ultra-concentrated version of prior drum solution was improved to minimize the amount of product needed to wash vehicles and provide a smaller container for both shipping and on-site storage and ease of use.

Some of the challenges and even hazards that result in use of drums include but are not limited to:

- Moving 400lb+ drums from the outside of our buildings to the backrooms
- Damage to expensive equipment when trying to maneuver drums around close quarters in a backroom
- Physical injuries to fingers when moving/relocating drums
- Having chemical splash-back into eyes, faces, and hands from the bung holes of drums
- Addressing Workman's comp claims from accidents that occurred while moving heavy drums and using them as ladders

Additionally, there are some long-term affects after using the drums that may not be avoided, rather purely consequential to their use:

- WC rates for car washes correlate to the total amount of claims related to the industry
- Any carbon footprint left from drum disposal could be an ongoing cost for years
- Extra fuel costs and taxes required to move these heavy products are incurred
- Long-term health and physical ailments due to a splash-back or spills can permanently alter lives

Although the readers of this article are a combination of those who use drum and ultra-concentrated product, here are some of the benefits of using the Ultraflex System:

- **Compatible** with all conventional car wash equipment
- **Flexible** you control and customize the car wash experience
- **Compact** takes up only a third of the space of conventional car wash products
- **Economical** you set the desired concentration level
- **Innovative** advanced chemical formulations, using nano-technology
- **Green** sustainable packaging, earth friendly ingredients
- **High Performance** ultra-concentrated formulations so very little chemical is needed to get desired results

Click here to learn more about our [Ultraflex System](#), celebrating 10 years since being awarded the Brian Campbell Leadership in Innovation Award!

In closing, it is encouraged to use ultra-concentrated chemical for an immediate return on investment-using less chemical to wash more vehicles, and in smaller containers to maximize use of backroom real estate.
